

A screenshot of a Windows-style application window titled "baseConv". The window has a menu bar with "File" and "Edit" options. The main content area displays a text-based program for base conversion. The program prompts the user to enter a number, its base, the decimal equivalent, and a target base for conversion. It then performs the conversion and displays the result. The program is executed four times with different inputs: a binary number (1010011110011101010) converted to base 16 (53CEA), an octal number (177371) converted to base 16 (FEF9), a hexadecimal number (FF00) converted to base 10 (65280), and a decimal number (2000) converted to base 2 (110110). The program terminates after the last conversion.

```
baseConv
File Edit

THIS IS A PROGRAM TO REPRESENT BASE CONVERSION.
Enter a number: 1010011110011101010
Enter the corresponding base of the entered number: 2
The decimal equivalent of the entered number is: 343274
Enter the targeted base for conversion: 16
1010011110011101010 Base-2 ==> 53CEA Base-16

Enter a number: 177371
Enter the corresponding base of the entered number: 8
The decimal equivalent of the entered number is: 65273
Enter the targeted base for conversion: 16
177371 Base-8 ==> FEF9 Base-16

Enter a number: FF00
Enter the corresponding base of the entered number: 16
The decimal equivalent of the entered number is: 65280
Enter the targeted base for conversion: 10
FF00 Base-16 ==> 65280 Base-10

Enter a number: 2000
Enter the corresponding base of the entered number: 3
The decimal equivalent of the entered number is: 54
Enter the targeted base for conversion: 2
2000 Base-3 ==> 110110 Base-2

Enter a number: 65535
Enter the corresponding base of the entered number: 10
The decimal equivalent of the entered number is: 65535
Enter the targeted base for conversion: 16
65535 Base-10 ==> FFFF Base-16

Enter a number:
